

Prediction-set categories: {no seizure} → rule-out (skip AED) · {seizure} → rule-in (target cEEG) · {seizure, no seizure} → defer to clinical judgment.

postop_A and postop_B differ only in the postop_B set omitting three variables (AED timing, prophylactic AED, abnormal EEG) that could in principle be charted after seizure onset; both achieve the same coverage and similar rule-out fractions.
